Automation in ST4 Cloud Pro

ST4 Cloud Automation

Automate routine work, stay in control

The next generation, significantly more powerful

The existing ST4 Automation has a proven track record and, with more than 100 customers, is the most widely used extension of SCHEMA ST4. ST4 Cloud Automation continues this success as the new generation. It performs well even in demanding scenarios, stays easy to follow for workflow designers in complex processes, and helps your team troubleshoot.

AI orchestration places demands that go beyond what the existing automation can do. ST4 Cloud Automation is built for this, so your team can use AI in targeted ways within workflows and keep control over processes and AI.

ST4 Cloud Automation is a cloud-native automation solution for SCHEMA ST4. It automates recurring technical writing processes and data exchange with other systems without complex programming, and it is ready for the targeted use of AI.

ST4 Cloud Automation grows with your requirements. It is based on the industry standard BPMN, which lets your technical writing team build workflows visually with a low-code approach.

If you use the existing ST4 Automation with SCHEMA ST4 On-Premises, it continues to run unchanged. In ST4 Cloud, we agree with you on the timeline for replacing the existing automation and build in generous lead times.

What improves for your team

- **Fewer clicks and errors**
- **More time for quality and compliance**
- **No manual data transfer**
- **New features, no update projects**
- **Workflows in Web Author, too**
- **Your team owns its processes**

What's inside ST4 Cloud Automation

Build complex workflows in modules with BPMN

Your workflows take shape as BPMN process diagrams and can be assembled from individual parts.

- The BPMN engine is integrated into ST4 Cloud Automation and optimized for ST4
- Quanos supports your team with best-practice guides and templates for recurring tasks
- Open standard with a large community, so your workflows aren't tied to a proprietary format
- A large ecosystem of tutorials, documentation, and AI support helps your team move forward

More stable workflows thanks to transparent debugging

Your team finds errors without lengthy searching and keeps track of every workflow.

- The point of failure is visible immediately, right in the affected workflow
- You can see at any time where a workflow stands and which values its variables hold
- KPIs and dashboards are built right in

A clearer overview and fewer clicks for your technical writing team

The completely new interface is made for everyone on your team who builds or uses workflows.

- Search workflows by name and mark them as favorites
- Visual feedback designed specifically for everyday technical writing
- Workflows now run in Web Author, too

Use AI selectively, on your team's terms

ST4 Cloud Automation is ready for AI, and your team decides where it supports your workflows.

- Build workflows, including automations and dialogs, using prompts, made possible by the open BPMN standard
- When modeling, define the points in a workflow where AI takes on individual tasks
- Use workflows as a Content Factory in which AI drives the process, while review steps and approvals set its boundaries

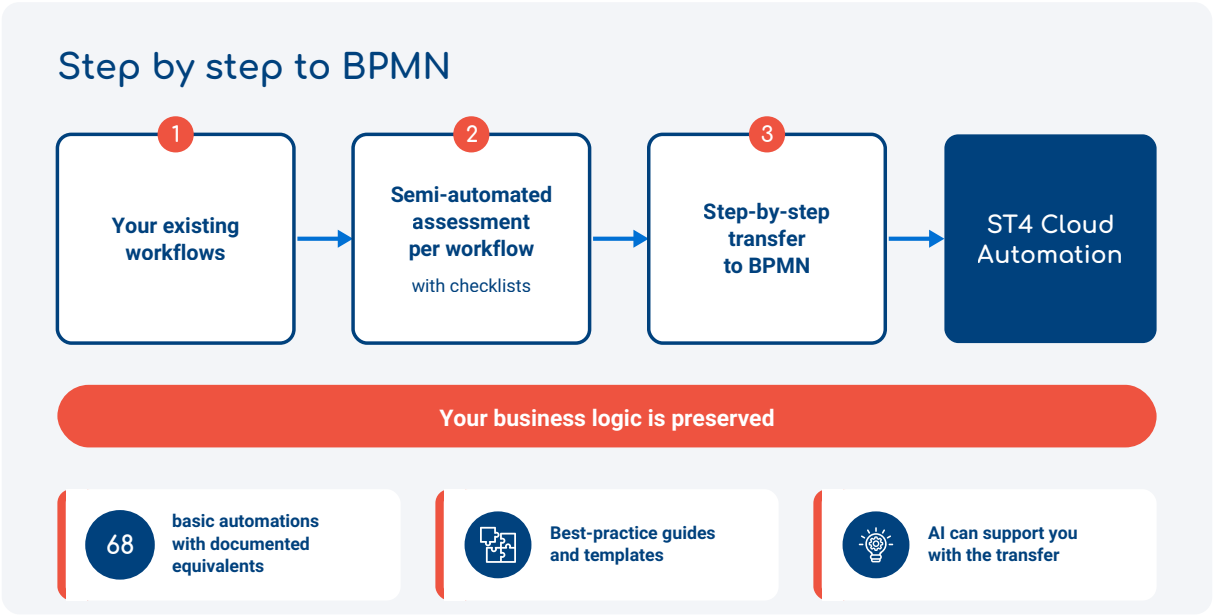

Who ST4 Cloud Automation is made for

- Technical writing teams looking to automate recurring, identical, or similar tasks in ST4
- Organizations that want to connect their documentation processes with PLM or ERP systems
- Teams that want to improve collaboration within the technical writing team and with other departments without complex programming

Transfer existing workflows or start fresh

Your existing workflows move to BPMN step by step, and their business logic is preserved.

- Semi-automated assessment of each workflow, with checklists and a check for required operations that will be implemented at a later date
- Documented BPMN-based equivalents for all 68 basic automations, and AI can support you as you transfer them
- Best-practice guides for loops and error handling, plus templates for recurring tasks, mean your team doesn't have to start from scratch

Whether you transfer existing workflows or are new to automation, your contact at Quanos plans your path to ST4 Cloud Automation with you. In this meeting, you'll also work out what support your team needs to get started. If you use the existing ST4 Automation, it's best to bring a list of your active workflows so you can estimate your timeline together.
